

Alex Vance

Age: 18

Gender: Female

Location: Lapaz, Iloilo City,
Philippines

Student

Alex is a college gamer who wants to build his own custom gaming desktop to save money. He knows what parts he wants to buy, but he is terrified of accidentally damaging components—like bending CPU pins or applying thermal paste incorrectly—during physical installation.

Goals

- Learn the correct step-by-step sequence for assembling a PC.
- Understand the function of each hardware component (GPU, RAM, Motherboard).
- Gain hands-on confidence in a risk-free virtual environment before buying real parts.

Pain points

- Overwhelmed by lengthy video tutorials and technical jargon.
- High anxiety about costly hardware mistakes.
- Lack of access to extra PC parts to practice on.

Challenges

- High Financial Risk: As a student on a strict budget, he cannot afford to replace parts if he damages them (e.g., bending CPU socket pins or cracking a motherboard).
- Information Overload: Long YouTube tutorials and tech forums are filled with jargon, conflicting advice, and unorganized instructions.
- Lack of Physical Practice: He has never opened a computer case before and lacks the tactile experience needed to know how much pressure to apply when seating RAM or latching a CPU.

Mark Tan

Age: 22

Gender: Male

Location: Oton, Iloilo City, Philippines

- **Occupation:** Vocational / Computer Technician Apprentice

Mark is training to become a certified computer hardware technician. He understands basic IT theory, but he needs rapid, repetitive practice with component identification, troubleshooting improper seating, and mastering system assembly to pass his practical skills assessment.

Goals

- Master hands-on hardware diagnostics and correct component seating procedures.
- Build speed and accuracy in assembling complete desktop setups.
- Prepare for formal computer systems servicing certification exams.

Pain points

- High anxiety during timed physical practical exams.
- Lack of instant feedback when a build fails to post or boot properly.

Challenges

- **Limited Lab Access:** Physical workshops have restricted opening hours, limiting his hands-on practice time.
- **Risk of Hardware Damage:** Making mistakes on live equipment can ruin components, leading to high replacement costs.
- **Complex Diagnostics:** Identifying subtle errors—such as improperly seated RAM or loose front panel connectors—is difficult without immediate, step-by-step guidance.

Persona Snapshot

Elena Rostova

Age: 34

Gender: Female

Location: Iloilo City, Philippines

- **Occupation:** Vocational / Computer Technician Apprentice

Elena works remotely and wants to build a budget-friendly workstation tailored for heavy multitasking. She prefers doing things herself to save money, but she has zero prior experience with computer hardware and feels intimidated by physical assembly.

Goals

- Learn computer hardware basics on her own schedule using a mobile app.
- Understand component compatibility (e.g., matching RAM types or power supplies).
- Successfully build her own work desktop without hiring a technician.

Pain points

- Dense technical manuals and forums are overwhelming for a beginner.
- Fear of buying incompatible or assembling them and correctly
- Busy daily schedule leaves that time for lengthy desktop base courses

Challenges

- **Limited Lab Access:** Physical workshops have restricted opening hours, limiting his hands-on practice time.
- **Risk of Hardware Damage:** Making mistakes on live equipment can ruin components, leading to high replacement costs.
- **Complex Diagnostics:** Identifying subtle errors—such as improperly seated RAM or loose front panel connectors—is difficult without immediate, step-by-step guidance.
