

USER STORIES

As a beginner student, I want to assemble PC components in a risk-free simulator so that I can practice without worrying about damaging expensive real hardware.

As a first-time builder, I want to see step-by-step visual feedback for seating RAM and CPU latches so that I can learn the proper assembly sequence without relying on long, confusing video tutorials.

As a beginner, I want to view educational info panels before placing a part so that I can understand what each component does.

As a beginner, I want to follow guided highlights and hints while building so that I can learn the correct assembly order step-by-step.

As a learner, I want to see glowing socket indicators so that I know where each component belongs on the motherboard.

As a beginner, I want to learn PC assembly using a simple 2D view so that I am not overwhelmed by complex 3D controls.

As a player, I want to follow a step-by-step core assembly loop so that I can build the desktop computer in the correct procedural order.

As a learner, I want to select and match the right part to its slot so that I can practice real-world component selection.

As a mobile user, I want to access an easy-to-understand tutorial so that I can start learning hardware concepts with zero prior experience.

As a player, I want to see clear success or error indicators immediately after dropping a part so that I know if my placement was correct.

As a mobile user, I want to interact using intuitive touch controls so that I can practice assembling PCs on my smartphone.

As a student, I want to drag and drop components into the motherboard so that I can practice assembling a computer interactively.
